SOFTWARE TESTING REPORT

PR-12: AI-Assisted Login Testing

Student Name	Bhavesh Patil
Enrollment Number	2504030100419
Programme	BCA — Semester 3
Testing Tools	Python, Selenium WebDriver, Google Chrome
Application Under Test	SauceDemo — saucedemo.com
Date	16 October 2026

Prepared for academic practical submission

1. Aim

To automate the login process on SauceDemo using Selenium WebDriver and verify that valid credentials navigate to the inventory/products page.

2. Objectives

• Open SauceDemo in Chrome. • Locate the username and password fields. • Enter valid credentials and submit the form. • Verify successful navigation to the inventory page. • Display the test outcome in the console.

3. Tools and Technologies

Tool	Purpose
Python	Language used to write the automated test.
Selenium WebDriver	Automates browser interactions and validation.
Google Chrome	Browser used to run the test.
WebDriverWait / Expected Conditions	Waits for elements and page conditions before continuing.
SauceDemo	Demo e-commerce site used as the application under test.

4. Test Case Details

Test Case ID	TC-PR12-01
Scenario	Login using valid credentials
Preconditions	Chrome and Selenium are configured; SauceDemo is accessible.
Test Data	Username: standard_user; Password: secret_sauce
Expected Result	Browser navigates to the inventory/products page.
Observed Result	Supplied console screenshot shows “AI-Assisted Login Test: PASS” and “Requirement Validation: PASS”; browser evidence shows the inventory page.
Status	PASS — based on supplied execution evidence

5. Test Procedure

1. Import Selenium WebDriver, By, WebDriverWait, and expected conditions.
2. Launch Chrome and maximize the browser window.
3. Set the explicit wait to 60 seconds to allow extra time for page elements to load.
4. Open https://www.saucedemo.com/.
5. Wait for the username field to become visible and enter standard_user.
6. Enter secret_sauce in the password field and click Login.
7. Wait until the current URL contains “inventory”.
8. Assert that “inventory” is present in the current URL and print the PASS messages.
9. Close the browser using driver.quit() in the finally block.

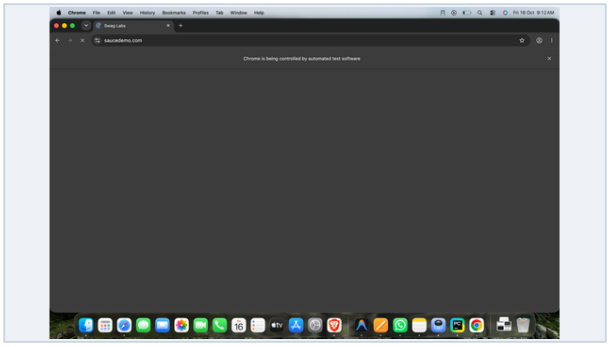

6. Result and Analysis

The supplied run output reports both checks as PASS, and the browser screenshots show the SauceDemo inventory page after login. This supports the successful-login outcome. The blank/loading browser states and Chrome Password Manager warning are incidental browser states rather than test assertions.

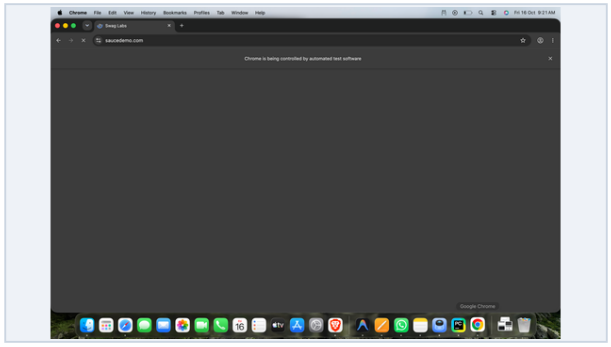

7. Screenshot Collage

All six screenshots supplied for PR-12 are combined below as visual evidence.

Screenshot 6

8. Individual Screenshot Evidence

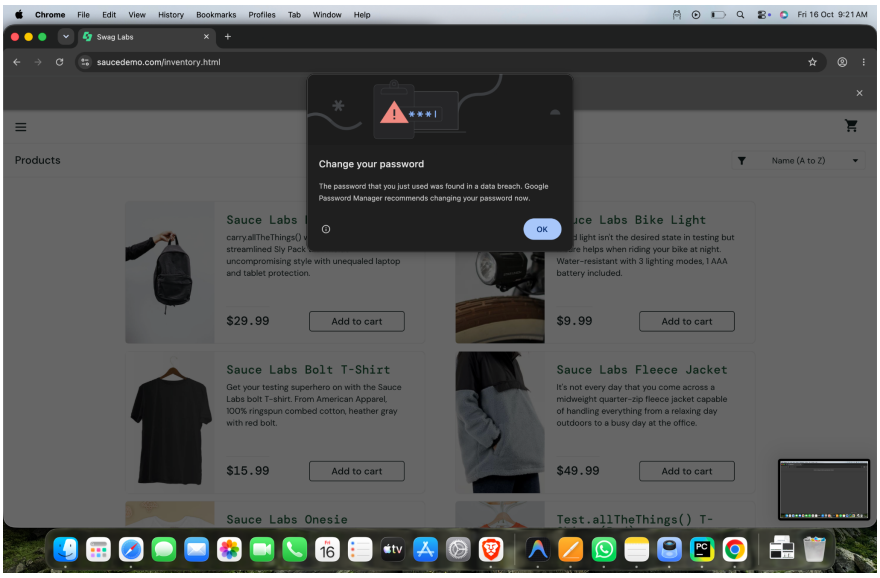

Screenshot 1 — SauceDemo page loading in Chrome.

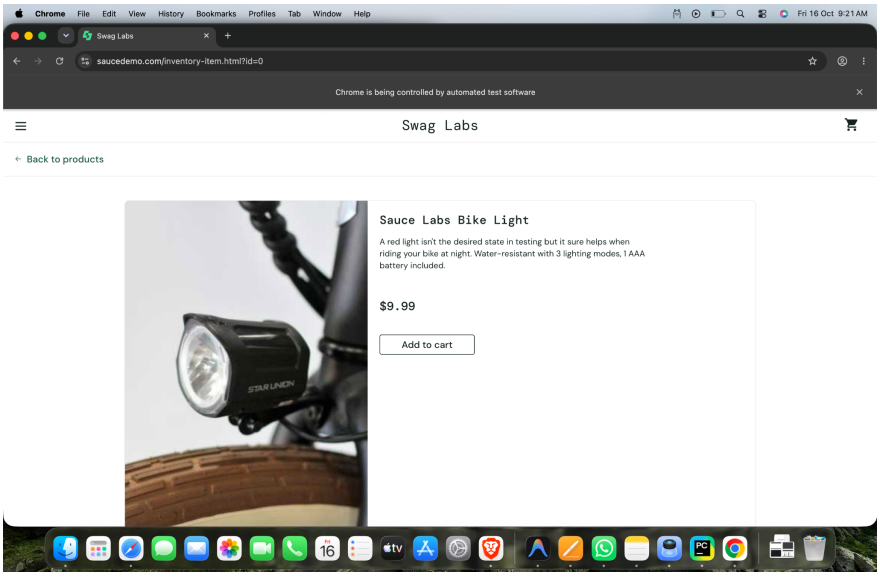

Screenshot 2 — SauceDemo inventory/products page.

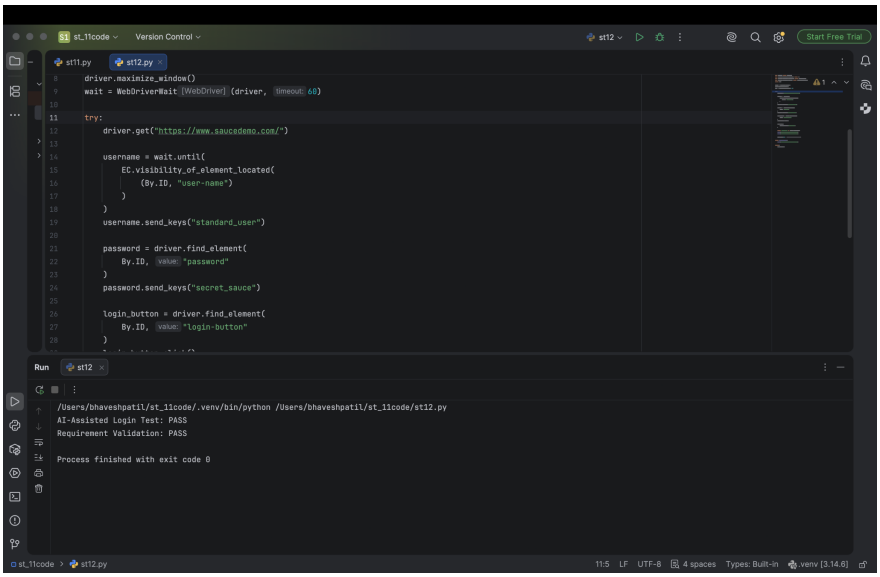

Screenshot 3 — Inventory page with Chrome Password Manager warning.

Screenshot 4 — SauceDemo product detail page.

Screenshot 5 — PyCharm script showing a 60-second explicit wait and passing run output.

Screenshot 6 — Console output showing both test checks as PASS.

9. Conclusion

PR-12 demonstrated AI-assisted automated login testing using Python and Selenium WebDriver. The supplied evidence indicates that valid credentials were accepted, navigation to the inventory page was verified, and both requirement checks passed. The explicit wait was increased to 60 seconds to allow additional time for elements to appear.

10. Notes

• This report is based on the screenshots and console output supplied. • The screenshots are supplied evidence; the shown test script does not itself save screenshots automatically. • To capture screenshots during future runs, add driver.save_screenshot("filename.png") at the required checkpoints.
